At Epiceros we develop frontend applications, mainly in React. So to get a better picture of how you would build a React application we would like you to take this CodePen and convert it into a React app:

https://codepen.io/StoraH/pen/MWJGbzM

You can use whatever frameworks you want for bootstrapping, styling and API integrations etc. Just use the tools you think are a good fit, and that you are comfortable working with. Also, while this is a small application, think of the bigger picture that the architecture (component/utility splits, folder structure etc) would hold even if the application grows.

The requirements, apart from being a React application, are these:
- The design of your application should match the CodePen
- The team member list should be fetched from this API:
https://run.mocky.io/v3/9118e647-e131-43c7-8668-d99af1abb5a6
- When the form is submitted, the name entered should be added to the list
- The application should be in a repository on Github, with clear README instructions on how we should run it
